ABSTRACT OF THE DISCLOSURE

A first information indication is removed from a display screen of a liquid crystal display device, when a screen size display mode is switched into a full-screen display mode where only second information is displayed on the display screen. When a notification mode for notifying the first information by using a notification unit is selected/set by operating a key unit, this first information is notified by employing a light-emitting diode for notifying a message reception, an LCD back light, a KEY back light, or a vibrator.
